

## OPTIMAL USE OF OLD AND NEW AEDS

Kamornwan Katanyuwong M.D.  
 Pediatrics Department  
 Chiang Mai University Hospital  
 การประชุมวิชาการประจำปี 2557  
 สหสมาคมโรคสมองซีกแห่งประเทศไทย

### Old vs New AEDs

*So which one?*

### Ideal characteristics for AEDs

<b>Efficacy</b> เหมาะสม, ชอบ	<ul style="list-style-type: none"> <li>broad <b>spectrum of indication</b></li> <li>rapid clinical improvement</li> <li>sustained efficacy</li> <li>lack of paradoxical effect</li> </ul>	ลด Freq, severity
<b>Tolerability</b> ใช้สบายใจ	<ul style="list-style-type: none"> <li>high therapeutic index</li> <li>not teratogenic</li> <li>few acute SE</li> <li>rare idiosyncratic SE</li> <li>rare serious or annoying chronic SE</li> </ul>	SE
<b>Ease of use</b> ง่าย เข้ากัน	<ul style="list-style-type: none"> <li>once/twice daily dosing</li> <li>linear pharmacokinetic</li> <li>no drug-drug interaction</li> <li>no relevant metabolism</li> <li>major route of excretion renal</li> <li>no titration to lowest effective dose</li> <li>no relevant protein binding</li> </ul>	Cost !!

### Special issue in children

- Absorption:** erratic absorption of PHT and PB in neonates
  - Distribution:** Vd of PB, PHT is larger in neonates than in older infants and children, need larger loading dose but similar loading doses of LZP, DZP
  - Elimination:** Birth; renal function ~25-30%  
 6 mo; renal function ~50-75%  
 2-3 yrs; full maturation
- Doses of drugs ...excreted predominantly unchanged by kidney...need to be reduced for neonates and infants

### Special issue in children

- CYP: Birth; ~50-70% of adult level  
 : 2-3 yrs; exceed than adult level  
 : puberty; similar to adult level
- CYP3A4 : CBZ
- UGT: low level in neonate an reach adult level at age 3-4 years

TABLE 1. Age effects on pharmacokinetic parameters (compared with adult values)

	Neonates/Infant	Children	Adults
Renal Metabolism	↓	↔	↔
CYP	↓	↑	↔
UGT	↓	↔	↔
Albumin	↓	↔	↔

CYP, cytochrome P450; UGT, uridine diphosphate, glucuronosyl transferase.

### Special issue in children

4. ในเด็กอาจจำเป็นต้องใช้ยากันชักในขนาดที่สูงกว่าเมื่อเทียบเป็น mg/kg/day และต้องให้ยาดีกว่าในผู้ใหญ่เพราะ

- บทบาทของ cytochrome P450 ซึ่งจะเกี่ยวกับ drug metabolism เช่น CYP 2C9, CYP 2C19 นั้น จะสมบูรณ์เหมือนผู้ใหญ่เพียงไม่กี่สัปดาห์หลังคลอดและการทำงานของ enzyme นี้จะยิ่งมากขึ้นเมื่อเป็นวัยรุ่นและเด็กเล็ก ก่อนที่จะลดลงเท่ากับระดับผู้ใหญ่เมื่อเข้าวัยรุ่น ดังนั้นการให้ขนาดของยากันชักในเด็กเล็กจึงต้องมากกว่าผู้ใหญ่
- ในเด็กจะมี ค่าครึ่งชีวิต (T 1/2) ที่สั้นกว่าในผู้ใหญ่ในบางตัวเช่น carbamazepine และ phenytoin ดังนั้นควรให้ยาหลายครั้งต่อวันมากกว่าที่จะให้ยาเพียงครั้งเดียว
- ร้อยเด็กเล็กจนถึงวัยรุ่น CYP 3A4 จะมี activity ที่สูงกว่าผู้ใหญ่ ทำให้ carbamazepine ถูกกำจัด ออกได้เร็วกว่า จึงสามารถให้ carbamazepine ได้มากถึง 3 ครั้งต่อวันในผู้ป่วยเด็ก

### Half-life

- Preterm, full-term neonates tend to have 3-9 times longer half-life than adult.
- Difference disappears by 2-6 months.
- Beyond 6 mo, half-life can be shorter than adult in specific drugs and pathway

13 yrs old girl

### Case

- Intermittent limbs shaking in the past 2 months
- Often occurs in the morning but also seen at other times

13 yrs old girl

### Case

- Intermittent limbs shaking in the past 2 months
- Often occurs in the morning but also seen at other times
- Recently, had one episode of GTC

### What would be your AED selection ?

- A. Depakine
- B. Phenytoin
- C. Topiramate
- D. Lamotrigine
- E. Levetiracetam

### What is your diagnosis ?

- A. Non-epileptic seizures
- B. Simple partial seizure
- C. Juvenile myoclonic epilepsy
- D. Partial with secondarily generalized seizure
- E. Epilepsy with grand mal seizure upon awakening

### Efficacy

- Seizure type and epileptic syndrome

Sz/AED	VPA	LTG	TPM	LEV
Myoclonic	✓	✓ ?	✓	✓
GTC	✓	✓	✓	✓
Absence	✓	✓	✓	✓

ILAE2006: Class IV : CZP,LTG,LEV,TPM,VPA,ZNS  
ILAE 2013: Level D : TPM, VPA

Epileptic disorder 2007

**What's the chance to have good seizure control in this patient?**

- A. 60%
- B. 70%
- C. 80%
- D. 90%
- E. 100%

**The main reason for Rx JME with other AEDS than VPA**

- The occurrence of side effects
  - Tremor
  - Weight gain
  - Loss of hair
- Pregnancy

14 yrs old

**Continued Case**

- Patient was given with VPA
- Titrate to 1,000 mg/day
- Good seizure control
- One year later...the patient is pregnant

**Intrauterine exposure to AED increases risk of congenital malformations**

- MCMs = structural abnormalities with surgical, medical or cosmetic importance.
- Minor malformation, facial dysmorphism, were not considered in statistic analysis

*Epilepsia 2009*

**Intrauterine exposure to AED increases risk of major congenital malformations**

The prevalence of MCM is

2.2% in all pregnancy	3.7% pregnancy c monoRx AED	6% pregnancy c polyRx AED
-----------------------	-----------------------------	---------------------------

*Epilepsia 2009*

1

**AED regimens with relatively high teratogenicity**

- **VPA** > 1,000 mg/day ( some > 1,500 )
- PB > 200 mg/day
- CBZ + VPA
- CBZ+ VPA+ PB+/- PHT
- PB+ PHT + primidone
- Benzodiazepines + other AEDs
- Caffeine + PB+/- other AEDs

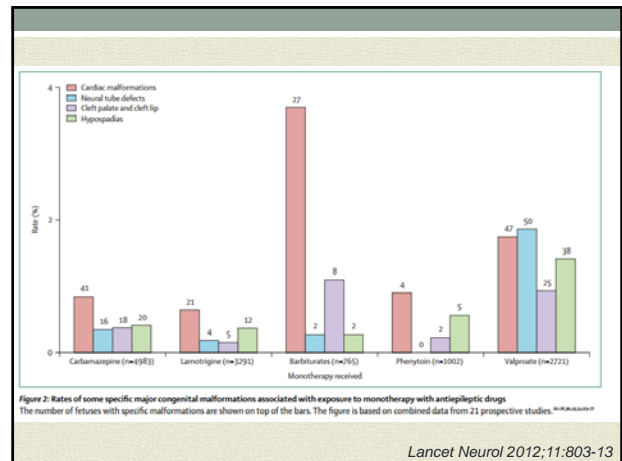

*Samren et al, Battino et al, Lindout et al, Dansky*

2

### AED regimens with relatively high teratogenicity

- Greater malformation in VPA > 1,500 mg/day
- No association between epilepsy type or GTC in the 1<sup>st</sup> trimester and a greater risk of major congenital malformation
- LTG > 200 mg/day in UK study but not others

*Lancet Neurol 2011*

### Neural tube defects: risk factors

Medical	Non medical
<ul style="list-style-type: none"> <li>• Prior NTD</li> <li>• Partner with NTD</li> <li>• Close relative with NTD</li> <li>• DM type 1</li> <li>• AED: VPA, CBZ</li> <li>• Pre-pregnancy obesity &gt; 110 kg</li> </ul>	<ul style="list-style-type: none"> <li>• Chemicals and pesticides</li> <li>• Cleansing solvents and disinfectants</li> <li>• Radiation</li> <li>• Anesthetic agents</li> <li>• Hot tubs, Saunas, Fever</li> <li>• Lead</li> <li>• Tobacco smoke</li> </ul>

### Intrauterine exposure to AED reduces cognitive outcome

**Recommendation to reduce risk of poor cognitive outcomes**

Cognitive risk related to AED exposure may be present throughout pregnancy

Level B: MonoRx should be considered in place of polyRx

Level B: Avoiding VPA should be considered

Level C: Avoiding PHT, PB may be considered

*Epilepsia 2009*

11 yrs old boy

### case

- F/U epilepsy case in OPD
- Underlying PDD, VSD
- Good seizure control in the past 6 months
- The mother asks about gum hypertrophy

11 yrs old

### case

- Underlying PDD, hyperactive child, VSD
- Epilepsy starts at age 5 years old
- Sz: body stiffening and left sided jerking, often seen in sleep, 2-4 times/day
- EEG: Rt T sharp/slow wave  
: B-TP/CP spike/slow wave
- 1<sup>st</sup> MRI : negative

2009

### Which AEDs would be your choice?

- A. Phenytoin
- B. Carbamazepine
- C. Depakine
- D. Topiramate
- E. Levetiracetam

}  
}

Sz: body stiffening and left sided jerking, often seen in sleep, 2-4 times/day

2009

### Treatment of new onset epilepsy

Drugs	Before 2004	Current
	Newly diagnosed MonoRx Partial sz	Newly diagnosed MonoRx Partial sz
Gabapentin	No	No <i>Yes: Add on</i>
Lamotrigine	Yes	Yes
Topiramate	Yes	Yes
Tiagabine	No	No <i>Yes: Add on</i>
Oxcarbazepine	Yes	Yes
Levetiracetam	No <i>Mono 16 yrs</i>	Yes <i>Add 1 mo</i>
Zonisamide	No	No <i>Yes: Add on</i>

2009

### Which AEDs would be your 1<sup>st</sup> AED?

- A. Phenytoin
- B. Carbamazepine
- C. Depakine
- D. Topiramate**
- E. Levetiracetam

}  
}

Sz: body stiffening and left sided jerking, often seen in sleep, 2-4 times/day

2009

### After commenced on 1<sup>st</sup> AED

- No seizure improvement
- What should we do next ?

- A. Switch to 2<sup>nd</sup> monotherapy
- B. Add on 2<sup>nd</sup> AED

### Add on 2<sup>nd</sup> AED

- A. Phenytoin
- B. Carbamazepine
- C. Depakine
- D. Phenobarbital
- E. Levetiracetam

}  
}

### Add on 2<sup>nd</sup> AED

- A. Phenytoin
- B. Carbamazepine
- C. Depakine**
- D. Phenobarbital
- E. Levetiracetam

}  
}

1

**Gum hypertrophy,  
Gingival enlargement/overgrowth**

**Drug induced enlargement**

: AEDs : PHT, 50%  
           : PB, LTG,VPA, VGB,ETX,TPX, primidone

: Cyclosporin 30%

: Ca channel blockers: amlodipine,  
                                   nifedipine, verapamil 10-20%

2

**Gum hypertrophy,  
Gingival enlargement/overgrowth**

- Drug induced enlargement
- Inflammatory enlargement
- Enlargement associated with systemic factors/condition (*pregnancy, Vt C def, leukemia, neoplasm*)

**Take home message: AED selection**

1. Seizure type	<ul style="list-style-type: none"> <li>• Clinical history, EEG, VEM</li> <li>• +/- imaging</li> </ul>
2. Efficacy & Tolerability	<ul style="list-style-type: none"> <li>• Mechanism</li> <li>• Indication/side effect</li> </ul>
3. Mono or polyRx	<ul style="list-style-type: none"> <li>• Indication</li> <li>• Basic science</li> </ul>
4. Drug interaction	<ul style="list-style-type: none"> <li>• With AEDs</li> <li>• With other medications</li> </ul>
