# EPILEPSY SYNDROMES OF ADOLESCENCE AND ADULTHOOD

SUDA JIRASAKULDEJ, MD

KING CHULALONGKORN MEMORIAL HOSPITAL

# EPILEPSY SYNDROME CLASSIFICATION 2022

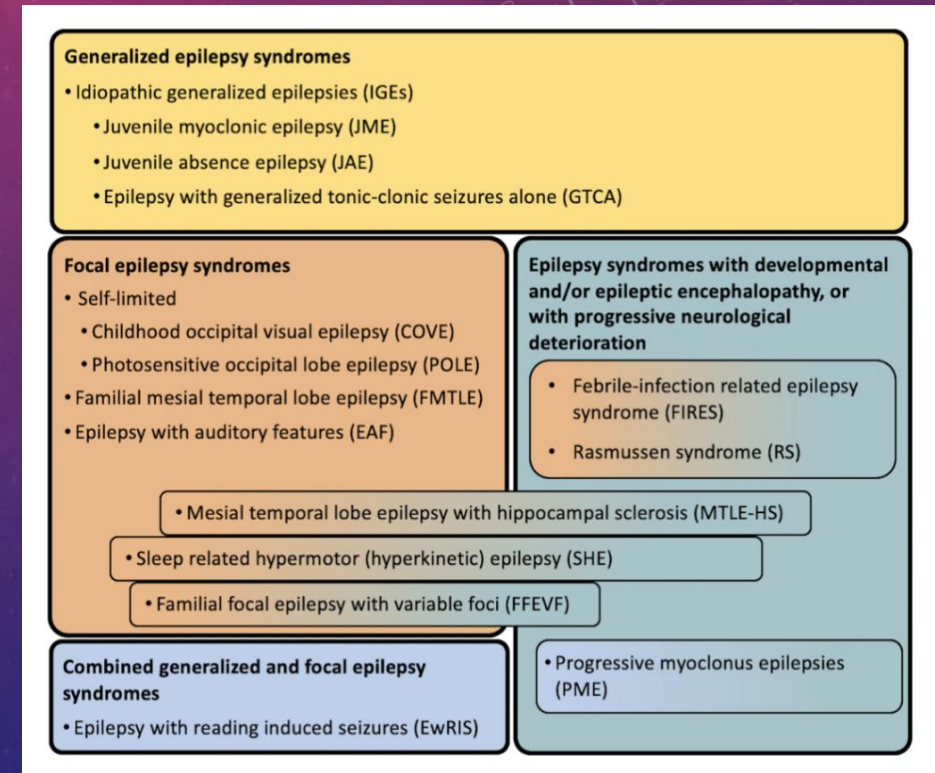

- Onset: neonatal/infant (up to 2 years), childhood, adolescent/adult (IGEs), variable age (ped & adult)
- Epilepsy type: focal, generalized, combined
- Associated with developmental and/or epileptic encephalopathy (DE and/or EE) or progressive neurological deterioration

# OUTLINE: EPILEPSY SYNDROME OF ADOLESCENCE AND ADULT

- **Focal epilepsy syndrome**
  - Sleep related hypermotor epilepsy (SHE)
  - Familial mesial temporal lobe epilepsy (FMTLE)
  - Epilepsy with auditory feature (EAF)
  - Familial focal epilepsy with variable foci (FFEVF)
  - MTLE-HS
- **Generalized epilepsy syndrome**
  - IGE: JAE, JME, GTCA
- **Combined generalized and focal epilepsy**
  - Epilepsy with reading induced seizure (EwRIS)
- **Epilepsy syndrome with DE and/or EE or with progressive neurological deterioration**
  - NORSE & Febrile infection related epilepsy syndrome (FIRES)
  - Rasmussen syndrome (RS)
  - Progressive myoclonic epilepsy (PME)

# FOCAL EPILEPSY SYNDROME

- Sleep related hypermotor epilepsy (SHE)
- Familial mesial temporal lobe epilepsy (FMTLE)
- Epilepsy with auditory feature (EAF)
- Familial focal epilepsy with variable foci (FFEVF)
- MTLE-HS

The background is a gradient from deep red at the top to dark blue at the bottom, speckled with white dots. Overlaid on this are several faint, white geometric elements: concentric circles, arcs, and a large circular scale with degree markings (40, 150, 160, 170, 180, 190, 200, 210, 220, 230, 240, 250, 260) and arrows indicating a clockwise direction.

# **SLEEP RELATED HYPERMOTOR EPILEPSY (SHE)**

# SLEEP RELATED HYPERMOTOR (HYPERKINETIC) EPILEPSY (SHE)

- Previously known as AD nocturnal frontal lobe epilepsy
- Attacks are associated with sleep rather than time of day
- Seizures may arise from extrafrontal sites
  - Insulo-opercular, temporal, parietal
- Motor aspects of seizures are characteristic
- Age at seizure onset mostly in first 2 decades of life
  - Typically in adolescence (11–14 yrs), range 2 months to 64 years

# CLINICAL FEATURES

- Brief (<2 minutes) seizures with stereotyped motor patterns within individuals
- Abrupt onset and offset
- Most common clinical expression consists of hypermotor events
  - Vigorous hyperkinetic features (complex body movements with kicking or cycling of limbs and rocking body movements), usually with vegetative signs, vocalization, emotional facial expression
  - Asymmetric tonic/dystonic seizures with or without head/eye deviation
- Seizures occur predominantly during sleep (non-REM)
- Seizure frequency may be very high , every night, usually many times per night
- Clustering is characteristic but not obligatory for diagnosis

# CLINICAL FEATURES

- Clinical features range from abrupt stereotyped arousals (paroxysmal arousal or minor motor events), repeated throughout the night or arising intermittently, with almost periodic pattern, to complex hypermotor seizures
- More seldom, protracted ambulatory behavior known as epileptic nocturnal wandering
- Events can last longer than 2 minutes

## TYPICAL FEATURES DISTINGUISHING NOCTURNAL PAROXYSMAL EPISODES

### REM

#### RBD

- Often in neurodegen. disorders
- Usually late onset
- No family history
- Last third of the night
- Memory of dream mentation

#### NIGHTMARE

- Tend to disappear throughout life
- Last third of the night
- Mild autonomic activation
- Memory of dream mentation

### NLFE

- Any age
- Any time during the night
- Several per night
- Brief duration (seconds)
- Stereotyped motor pattern
- Strong autonomic activation

### NREM

#### DISORDERS OF AROUSAL

- Tend to disappear throughout life
- Triggering factors
- First third of the night
- Usual amnesia

## **SHE**

- Duration: Brief < 2 min
- Frequent, clustering
- Stereotyped
- Hypermotor/hyperkinetic
- Non-REM: N1/N2, transition between sleep stage

## **Arousal parasomnia**

- Longer: Several minutes
- Infrequent, sporadic
- Not stereotyped
- Less frenetic, more goal-oriented
- Stage 3 non-REM, most often first half of the night

**Table 2** Distinctive clinical features of nocturnal frontal lobe seizures and the most common parasomnias.

	Disorders of arousal	Nightmares	RBD	NFLS
Age at onset (yrs)	3–8	Usually 3–6	After 50	Any age
Gender	Either	Either	Male predominance	Male predominance
Family history of parasomnias	+	+	—	+
Spontaneous evolution	Tend to disappear	Tend to disappear	Rare spontaneous remission	Increased frequency?
Episodes/month	Sporadic	Sporadic	Almost every night	Almost every night
Occurrence during the night	First third	Last third	At least 90 min after sleep onset	Any time
Sleep stage onset of episodes	NREM sleep (st. 3–4)	REM sleep	REM sleep	NREM (mainly st. 2)
Triggering factors	++ (Sleep deprivation, febrile illness)	++ (Stress, traumatic events)	—	±
Episodes/night	Usually one	Usually one	From one to several	Several
Episodes duration	1–10 min	3–30 min	1–2 min	sec to 3 min
Stereotypic motor pattern	—	—	—	+
Autonomic discharge	+++	+	—	++(+)
Consciousness if awakened	Impaired	Normal	Normal	Normal
Recall of the episode if awakened	No	Yes	Yes	Inconstant

# SHE

- Etiology: Structural (FCD), genetic (CHRNA4, CHRNA2, CHRNB2, KCNT1, DEPDC5, NPRL2, NPRL3, PRIMA1), acquired
- Course of illness: related to underlying etiology

# EEG

- Awake: Normal BG, non-epileptiform in most (50%–90%) patients
- Sleep: IEDs over frontal areas in approximately 50%
- Ictal EEG
  - May not show definitive ictal patterns, obscured by movement artifact
  - Evolving sharp or spike-and-wave discharges, rhythmic slow activity
  - Diffuse background flattening over frontal areas
- Postictal focal slowing
- Prolonged video EEG: best diagnostic test to identify events with stereotyped semiology from sleep to confirm diagnosis

# ICTAL EEG

The background features a gradient from deep red at the top to dark blue at the bottom. Overlaid on this are several faint, white, circular and semi-circular lines of varying thicknesses. Some of these lines have small arrows indicating a clockwise or counter-clockwise direction. There are also some faint, curved lines that resemble parts of a larger circular structure, possibly a clock face or a compass rose, with some numbers visible (e.g., 150, 160, 170, 180, 190, 200, 210, 220, 230, 240, 250, 260).

# **MESIAL TEMPORAL LOBE EPILEPSY WITH HIPPOCAMPAL SCLEROSIS**

# MTLE WITH HS

- Age at seizure onset is typically in adolescent and young adult years
- Seizure is gradual onset and offset
- Focal aware or impaired awareness seizures with semiological features referable to medial temporal lobe networks
  - Focal aware seizures: autonomic (rising epigastric sensation, abdominal discomfort, nausea, retching, pallor, flushing, tachycardia), cognitive (déjà vu, jamais vu), emotional (fear), or sensory (olfactory, gustatory)
  - FIAS:
    - Behavioral arrest, often automatisms may be oral (chewing, lip- smacking, swallowing), vocal, or gestural, upper limb automatisms may be unilateral and may lateralize to ipsilateral hemisphere
    - Contralateral upper limb dystonia may develop
    - Aphasia is common with dominant MTLE- HS

# EEG

- Focal slow over temporal area
- Temporal intermittent rhythmic delta activity
- Epileptiform abnormality over ipsilateral anterior temporal region, may be bilateral and independent, or bilaterally synchronous
- Ictal EEG changes are marked by rhythmic temporal alpha or theta activity within 30 seconds of clinical onset

# INTERICTAL EEG

# MTLE WITH HS

- Imaging: hippocampal sclerosis, increased signal and loss of volume (15% dual pathology)
- Often drug resistance, may full remission after epilepsy surgery

The background is a gradient from deep red at the top to dark blue at the bottom, speckled with white dots resembling stars. Overlaid on this are several faint, white circular and semi-circular lines, some with arrows indicating a clockwise direction. A large circular scale with numerical markings from 140 to 260 is visible on the left side.

# **FAMILIAL MESIAL TEMPORAL LOBE EPILEPSY**

# FMTLE

- Typically onset in adolescence or adulthood (3-63 yr)
- Clinical seizure: focal aware seizures with **mTLE semiology**
  - Clinical vary between **mild syndrome with prominent déjà vu (most common)** to more severe phenotype with febrile seizures and HS
- Typical form, seizures are mild and occur infrequently
- **FH of individuals with focal seizures arise from mesial temporal lobe**
- Normal intellectual development and no associated neurological abnormalities
- History of febrile seizures is uncommon with typical presentation
- **Normal MRI or HS/atrophy**: exclude other pathology

The background is a gradient from deep red at the top to dark blue at the bottom, speckled with white dots. Overlaid on the left side are several concentric circles and a large circular scale with degree markings from 140 to 260. Some circles have arrows indicating a clockwise direction.

# **EPILEPSY WITH AUDITORY FEATURES**

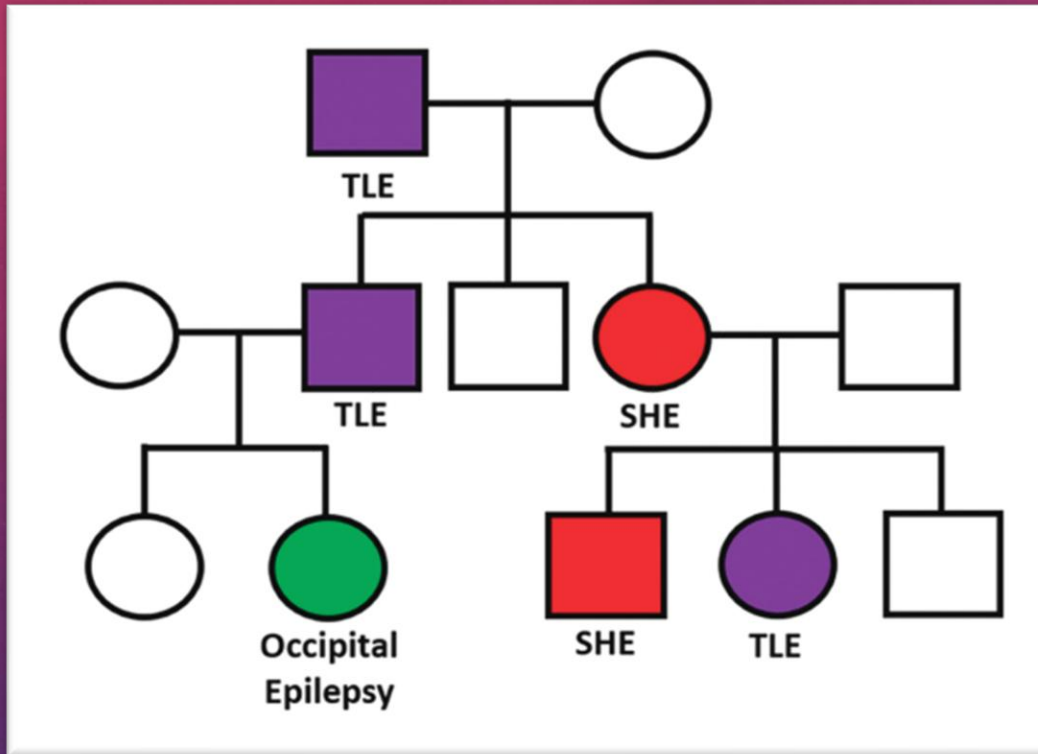

# EAF

- Mostly sporadic, also ADEAF (related gene LGI1, RELN, MICAL1)
- Onset adolescence or early adulthood
- **Focal aware seizures with auditory symptoms and/or receptive aphasia**
- Rarely may have focal to bilateral tonic–clonic seizures
- Some patients have seizures precipitated by specific sounds
- **1/3 are drug resistant**
- MRI: normal or FCD

The background is a gradient from deep purple at the top to dark blue at the bottom, speckled with small white dots. Overlaid on this are several faint, white geometric patterns. These include concentric circles of varying sizes, some with dashed lines, and circular arcs with tick marks and degree labels (40, 150, 160, 170, 180, 190, 200, 210, 230, 240, 250, 260). Some of these arcs have small arrowheads pointing in different directions, suggesting a sense of rotation or movement.

# **FAMILIAL FOCAL EPILEPSY WITH VARIABLE FOCI**

# FFEVF

Example pedigree

Continuum (Minneapolis, Minn.). 2022;28(2):339-362.

- Rare AD familial focal epilepsy syndrome
- Focal seizures arising from different cortical regions (most common frontal or temporal) in different family members with variable severity
- Every individual in family have single focal seizure type
- Most cases are responsive to ASMs
- Selected patients with DRE and FCDII, epilepsy surgery may result in full remission

# Focal Epilepsy Syndrome (SHE, FMTLE, FFEVF, EAF)

Syndrome	Onset (usual)	Clinical	Interictal EEG	Imaging
SHE	Second decade of life	From sleep, brief hyperkinetic or asymmetric tonic/dystonic motor seizures	Background interictal EEG is usually normal; focal (usually frontal) epileptiform abnormality can be seen	Normal, FCD, or acquired structural abnormality
FMTLE	Adolescence or adulthood	Typically, focal aware seizures with intense déjà vu and associated features, e.g., dreamy perceptions, fear or panic, slow motion, visual or auditory illusions, and autonomic manifestations	Background interictal EEG is usually normal or may show mild temporal slowing; temporal epileptiform abnormality can occasionally be seen	Normal, rarely hippocampal atrophy or increased T2 signal
FFEVF	First or second decade of life	Focal seizures, semiology dependent on focal cortical area involved in an individual, but constant in that individual	Background interictal EEG is usually normal; focal epileptiform abnormality can be seen	Normal or FCD
EAF	Second or third decade of life	Sensory seizures (auditory), cognitive seizures with receptive aphasia	Background interictal EEG is usually normal; focal (usually temporal) epileptiform abnormality can be seen	Usually normal, although posterior temporal FCD reported

## Focal Epilepsy Syndrome (SHE, FMTLE, FFEVF, EAF)

Focal epilepsy syndrome	Related genes
SHE	<i>CHRNA4, CHRNA2, CHRNB2, DEPDC5, KCNT1, NPRL2, NPRL3, PRIMA1</i>
FMTLE	<i>DEPDC5</i> (Mendelian inheritance is rare, FMTLE typically displays complex inheritance)
FFEVF	<i>TSC1, TSC2, DEPDC5, NPRL2, NPRL3</i>
EAF	<i>LGI1, RELN, MICAL1</i>

Abbreviations: EAF, epilepsy with auditory features; FFEVF, familial focal epilepsy with variable foci; FMTLE, familial mesial temporal lobe epilepsy; SHE, sleep-related hypermotor (hyperkinetic) epilepsy.

The background is a gradient from deep red at the top to dark blue at the bottom, speckled with white dots. Overlaid on this are several faint, white geometric elements: concentric circles of varying sizes, some with dashed lines, and a large circular scale with tick marks and numbers ranging from 140 to 260. Some of the circles have small arrows indicating a clockwise direction.

# **GENERALIZED EPILEPSY SYNDROME**

# GENERALIZED EPILEPSY SYNDROME

- JAE
- JME
- GTCA

# Genetic Generalized Epilepsies

## Idiopathic Generalized Epilepsies

Childhood  
Absence  
Epilepsy  
*CAE*

Juvenile  
Absence  
Epilepsy  
*JAE*

Epilepsy with  
Generalized  
Tonic-Clonic  
Seizures Alone  
*GTCA*

Juvenile  
Myoclonic  
Epilepsy

Eyelid Myoclonia  
*EEM*

Epilepsy with  
Myoclonic Absences  
*EMA*

Myoclonic Epilepsy  
in Infancy  
*MEI*

## Developmental Encephalopathy

## Prevalence of active GGE syndromes across the lifespan

# GGE

- Functional imbalance of bilateral frontothalamocortical networks → seizure & cognitive impairment
- Neuropsychological deficits and psychiatric traits
  - Poorer academic performance
  - Dysfunctional social cognition
  - Personality disorder: impulsivity, emotional instability
  - Affective & anxiety disorder
- Genetic: Polygenic modes of inheritance (combinations of multiple gene alterations)

**\*\* esp. GABA receptor subunit \*\***

# GENETIC DEFECT IN SOME GGE

Gene	Locus	Protein	Phenotype
<i>GABRG2</i>	5q31–33	GABA <sub>A</sub> receptor $\gamma_2$ -subunit	CAE and FS
<i>GABRA1</i>	5q34–35	GABA <sub>A</sub> receptor $\alpha_1$ -subunit	JME, CAE
<i>CLCN2</i>	3q26	ClC-2 voltage-gated Cl <sup>-</sup> channel	CAE, JAE, JME, EMA
<i>EFHC1</i>	6p11–12	Myoclonin1	JME
<i>CACNA1H</i>	16p13.3	T-type Ca <sup>2+</sup> channel $\alpha_{1H}$ -subunit	CAE
<i>CACNB4</i>	2q22–23	Ca <sup>2+</sup> channel $\beta_4$ -subunit	JME, JAE
<i>CACNA1A</i>	19p13	P/Q-type Ca <sup>2+</sup> channel $\alpha_{1A}$ -subunit	CAE with ataxia
<i>RORB</i>	9q21.13	Transcriptional factors	Eyelid myoclonia with Ab
<b>List of loci from genome-wide linkage analyses of small multiplex families</b>			
1p, 2q36, 3q26, 5q12–q14, 5q34, 6p21, 8q24, 8p, 9q32–33; 10q25–26, 10p11, 11q13, 13q22–31, 14q23, 15q14, 18q21, 19q13			IGE, CAE, JME
<b>List of CNVs, risk factors of IGE</b>			
Microdeletions: 15q13.3, 15q11.2, 16p13.11			IGE, JME
Duplication: 1q21.3			Early onset CAE

CAE, childhood absence epilepsy; EMA, myoclonic–astatic epilepsy; FS, febrile seizures; IGE, idiopathic generalized epilepsy; JAE, juvenile absence epilepsy; JME, juvenile myoclonic epilepsy.

# JUVENILE ABSENCE EPILEPSY

# JAE

- Age of onset 9-13, range 8-20 years
- Absence seizure, less than daily
- GTCs > 90% shortly after absence seizure
- Triggers: sleep deprivation, alcohol, HV
- Normal development and cognition (+/-ADHD, LD)

# JAE EEG

- **Interictal**

- 3-5.5 Hz Generalized spike/polyspike, may show focal abnormality, asymmetrical burst of spike/polyspike waves
- SW: less organized, more fragmented than CAE

- **Ictal**

- Generalized 3-5.5Hz spike/polyspike waves elicit by hyperventilation
- Absences may have a faster rhythm of GSW at 4–5Hz, esp. at onset
- Photoparoxysmal response 25%

	CAE	JAE
Age at onset	2 to 13 years (4-10)	8-20 years (9-13)
Absence seizure	More frequent (10s-100s/day) Cluster Shorter duration 3-20s Severe loss of awareness	Less frequent (1-10/day) Sporadic Longer duration 5-30s Less complete impaired awareness
GTCs	Less common	More common
EEG	Bilateral, 3Hz (2.5-4) synchronous, symmetrical SW  Irregular generalized SW uncommon  OIRDA 21%	Generalized spike/PSW 3-5.5 Hz  Irregular generalized SW more common

# JAE

- Typically pharmacoresponsive syndrome
  - ETX, VPA, LTG
- Avoided PHT, CBZ, GBP, pregabalin, vigabatrin
- Lifelong requirement for medication expected

The background is a gradient from deep red at the top to dark blue at the bottom, speckled with small white dots. Overlaid on the left side are several concentric circles and a large circular scale with degree markings from 140 to 260. Some circles have arrows indicating a clockwise direction.

# JUVENILE MYOCLONIC EPILEPSY

# JME

- 5% to 10% of all epilepsy, onset 10-24 years (8-40)
- Most constant clinical feature is **myoclonic seizures**
  - Predominantly involving upper extremities (shoulder, arm, rarely distal)
  - Generally bilateral
  - Especially upon awakening, within 2 hour after awakening
  - 25% asymmetrical
- Majority develop **GTCs**, usually shortly after awakening
  - Often preceded by series of myoclonic seizures → **myoclonic-tonic-clonic seizure**
- At least 1/3 experience **absence seizures**

# JME: EEG

- Normal EEG background
- Abrupt paroxysmal generalized 4-6 Hz spike or PSW (fast spike and wave)
  - More frequent in the morning than evening
  - Increased in frequency during sleep (most prominent N1, N2)
  - Transition from sleep to awake, arousal
- +/- Focal spike
- Potentiated by sleep/sleep deprivation, alcohol use, menses, photic stimulation (>1/3 PPR, typically at 10-30Hz PS), HV
- **Improved yield of EEG:** total or partial sleep deprivation, cont. at least 30 min after awakening, PS, HV, EMG

Spike F4

# JME MANAGEMENT

## ASMs

- VPA is efficacious
  - Avoid in women of child-bearing age
- LEV, LTG may be effective
- Myoclonic seizure worsened by CBZ, OXC, PHT, GBP, VGB

## Counselling

- Lifestyle modification
- Medication compliance
- Avoid alcohol & illicit drug
- Avoid sleep deprivation
- Avoid flashing lights (40-90% photosensitive)

# NATURAL HISTORY

- 65%– 92% of patients are drug responsive
- Sodium channel blockers often aggravate myoclonic and absence seizures
- Lamotrigine may aggravate myoclonic seizures in some patients
- Usually considered a lifelong disorder, often requiring lifelong therapy
  - Occasional cases may successfully discontinue ASMs later in life

# **EPILEPSY WITH GENERALIZED TONIC-CLONIC SEIZURES ALONE**

# EPILEPSY WITH GTCS ALONE

- Typical age of onset of 16 years (6-28)
- Seizure peak in early morning
- Small peak upon falling sleep/naps or in the evening
- EEG: 4-5 Hz generalized spike/polyspike-and-slow-wave
- Triggers: sleep deprivation, photic stimulation, stress, alcohol
- Pharmacoresponsive, but lifelong predisposition to seizure expected

# Summary clinical presentation of GGE

Table 1 | Typical clinical presentations of GGE syndromes

Syndrome	Approximate proportion of adults with GGE (%)	Seizure types	Typical age at onset (peak) (years)	Sex ratio
Childhood absence epilepsy	15	Absence (100%) <sup>a</sup> Tonic-clonic (20%)	4–12 (6)	F > M
Juvenile absence epilepsy	15	Absence (100%) <sup>b</sup> Tonic-clonic (90%) <sup>c</sup>	8–20 (14)	F = M
Juvenile myoclonic epilepsy	45	Myoclonic (100%) Absence (30%) <sup>b</sup> Tonic-clonic (90%) <sup>d</sup>	6–25 (14)	F ≥ M
Epilepsy with generalized tonic-clonic seizures alone	25	Tonic-clonic (100%)	5–40 (17)	F = M

Overlaps:  
CAE & JAE

Phenotypic  
inconclusive in  
about 1/5

Evolving:  
CAE → JME

The background features a gradient from deep red at the top to dark blue at the bottom, speckled with white dots. Overlaid on this are several faint, white circular and semi-circular lines, some with arrows indicating a clockwise direction. A large circular scale with numerical markings (40, 150, 160, 170, 180, 190, 200, 210, 220, 230, 240, 250, 260) is visible on the left side.

# **EPILEPSY WITH READING INDUCED SEIZURE**

# EWRIS

- Rare combined generalized and focal epilepsy syndrome
- Reflex myoclonic seizures affecting orofacial muscles triggered by reading +/- → BTC
- Triggers: reading, language related task (talk, writing, making complex decision)
- Typically in late teens (median=17.5 years, range = 10–46 years)
- Developmental, neuro exam, MRI: normal
- Favorable prognosis

# EPILEPSY SYNDROME WITH DE AND/OR EE OR WITH PROGRESSIVE NEUROLOGICAL DETERIORATION

- NORSE & Febrile infection related epilepsy syndrome (FIREs)
- Rasmussen syndrome (RS)
- Progressive myoclonic epilepsy (PME)

The background is a gradient from dark red at the top to dark blue at the bottom. It features several faint, white, concentric circles and a radial scale with numbers ranging from 140 to 260. The scale is positioned on the left side, with numbers increasing outwards. There are also some dashed lines and arrows pointing inwards towards the center.

# **NEW ONSET REFRACTORY STATUS EPILEPTICUS (NORSE) & FEBRILE INFECTION RELATED EPILEPSY SYNDROME (FIRES)**

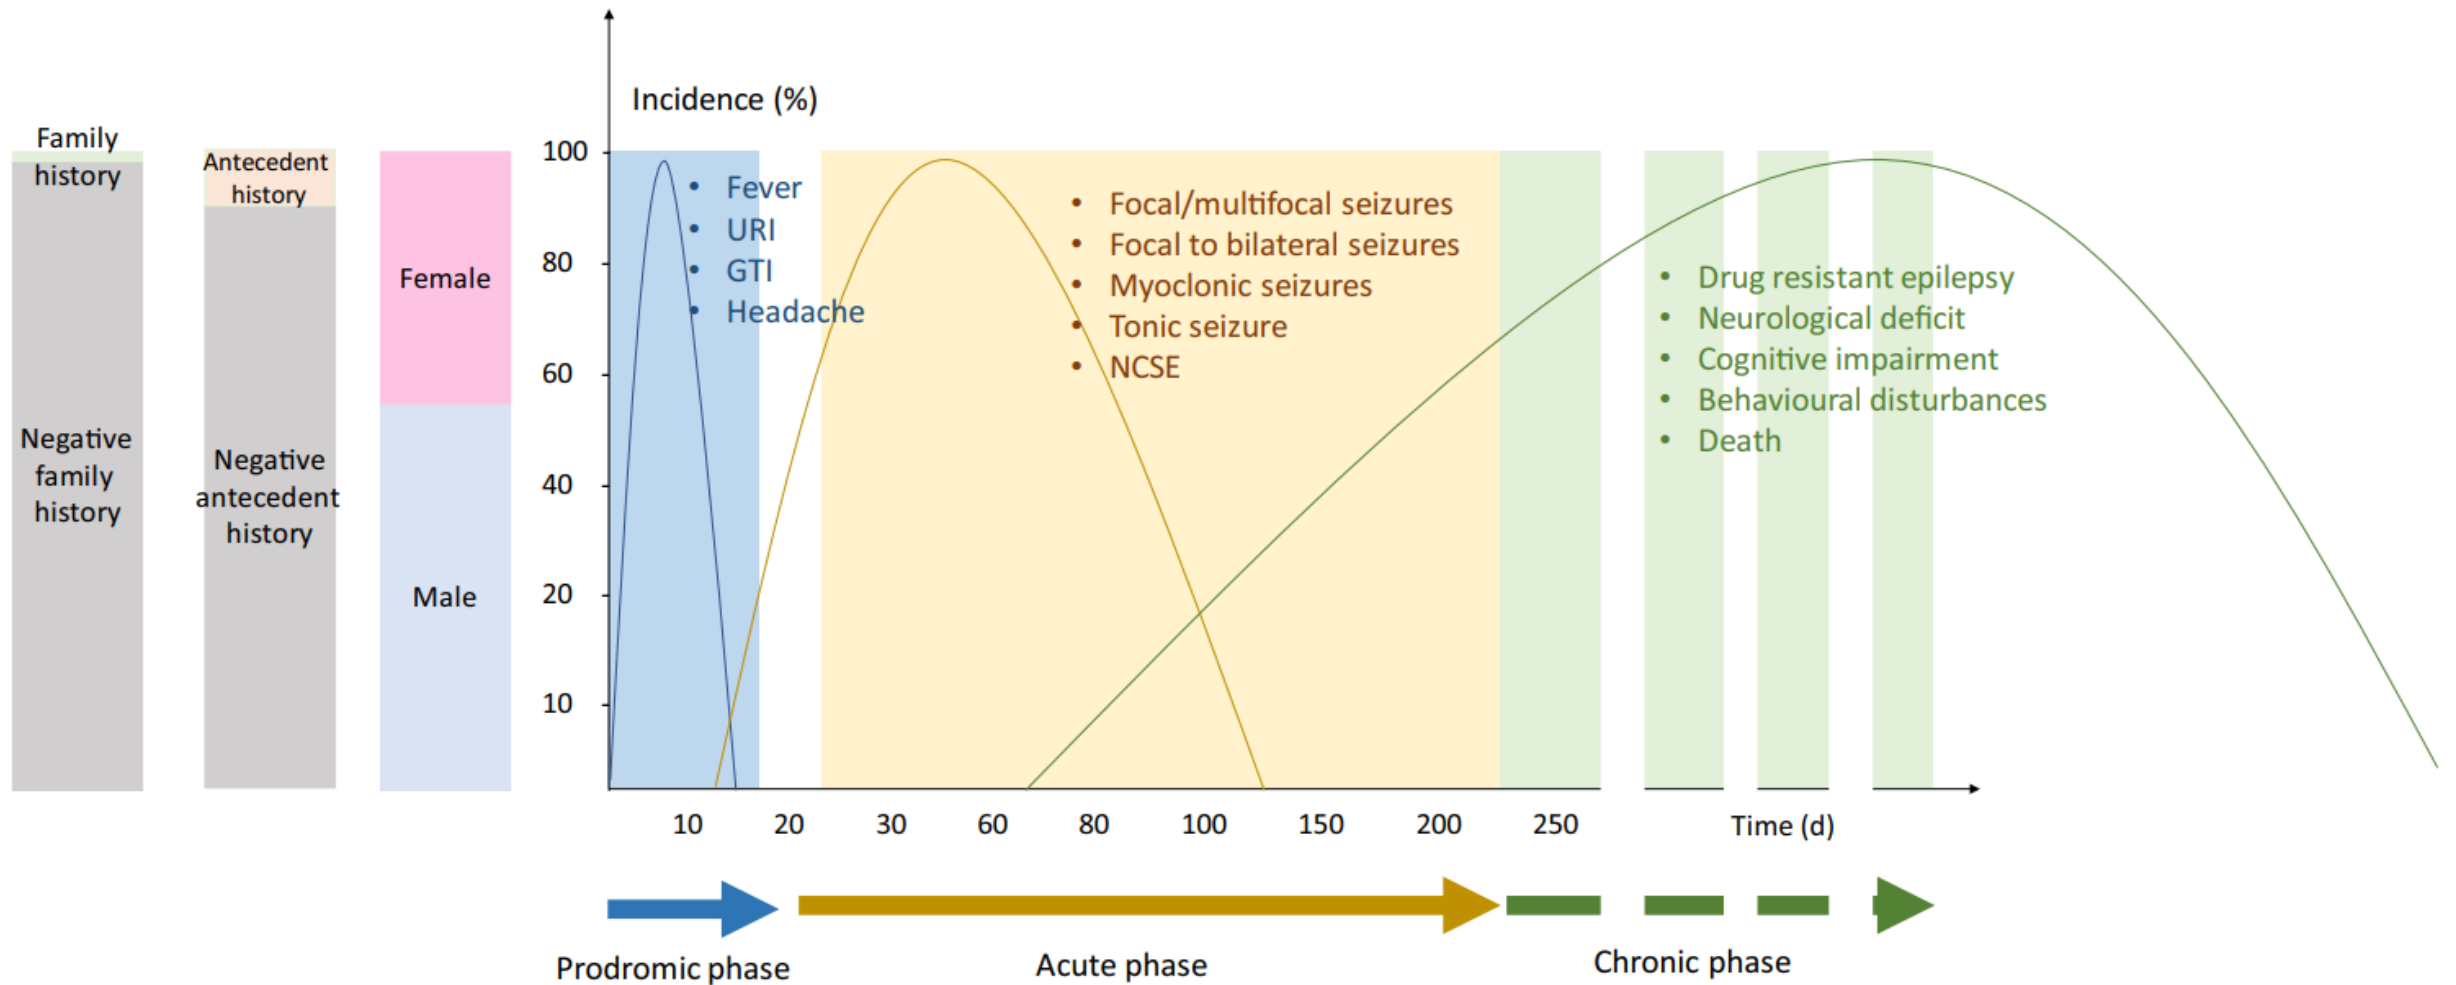

## NEW-ONSET REFRACTORY STATUS EPILEPTICUS

- Rare clinical presentations characterized by **de novo onset of RSE** in patient without active epilepsy and without clearly identifiable acute or active structural, toxic, or metabolic cause
- FIRES is considered a subcategory of NORSE, diagnosis requires prior **febrile infection starting between 2 weeks and 24 hours** before onset of RSE

# NORSE & FIRES

- Mainly affect school-age children and young adults
- **Acute phase**: high seizure burden, lasts 1–12 weeks
- **Chronic phase**: drug-resistant multifocal epilepsy and intellectual disability or learning difficulties

# Clinical findings of FIRES & NORSE

# Etiology assessment

**Table 1 – Aetiological assessment. Adapted from [14,40].**

MRI brain with contrast angiography and venography Blood and serum analysis	Recommended in all patients
	Standard biological assessment Autoimmune antibody panel: ANA, ANCA, anti-thyroid, anti-neuronal surface antigens, onconeural antibody panel VDRL, HIV 1-2, bacterial and fungal cultures Bacterial serologies: <i>Chlamydia pneumoniae</i> , <i>Bartonella henselae</i> , <i>Mycoplasma pneumoniae</i> , <i>Coxiella burnetii</i> , <i>Shigella</i> sp. and <i>Chlamydia psittaci</i> Respiratory viral DFA panel; SARS-CoV2 PCR Multiplex PCR Cell counts, protein, and glucose, immunoelectrophoresis Bacterial and fungal stains and cultures including <i>Mycobacterium tuberculosis</i> RT-PCR for HIV, PCR for HSV1-2, VZV, EBV PCR for <i>Chlamydia pneumoniae</i> , <i>Bartonella henselae</i> , <i>Mycoplasma pneumoniae</i> , <i>Coxiella burnetii</i> , <i>Shigella</i> sp. VDRL, Lyme Paraneoplastic and autoimmune epilepsy antibody panel
Nasopharyngeal swab Gastrointestinal pathogens CSF	
EEG	
Serum analysis CSF	Immunocompromised patients Serology for cryptococcus species, <i>Histoplasma capsulatum</i> , <i>Toxoplasma gondii</i> Stain for fungi, PCR for <i>Toxoplasma gondii</i> , JC Virus, CMV, HHV6, parvovirus ± West Nile Virus
	Risk of exposure to specific pathogens according to geographical factors Oncological screening Cancer serum markers CSF cytology and flow cytometry
Serum analysis CSF	
CT chest-abdomen-pelvis, pelvic or scrotal ultrasound, pelvic MRI, mammogram whole body PET CT	Screening for inborn error of metabolism and mitochondrial disorders
Ammonia, acute porphyria screen, LDH, urine analysis Plasma and CSF lactate, pyruvate, muscle biopsy	
	Genetic screening Panel, whole exome, CGH array, mitochondrial genome sequencing Brain biopsy

**Etiology**

**Unknown 50%**

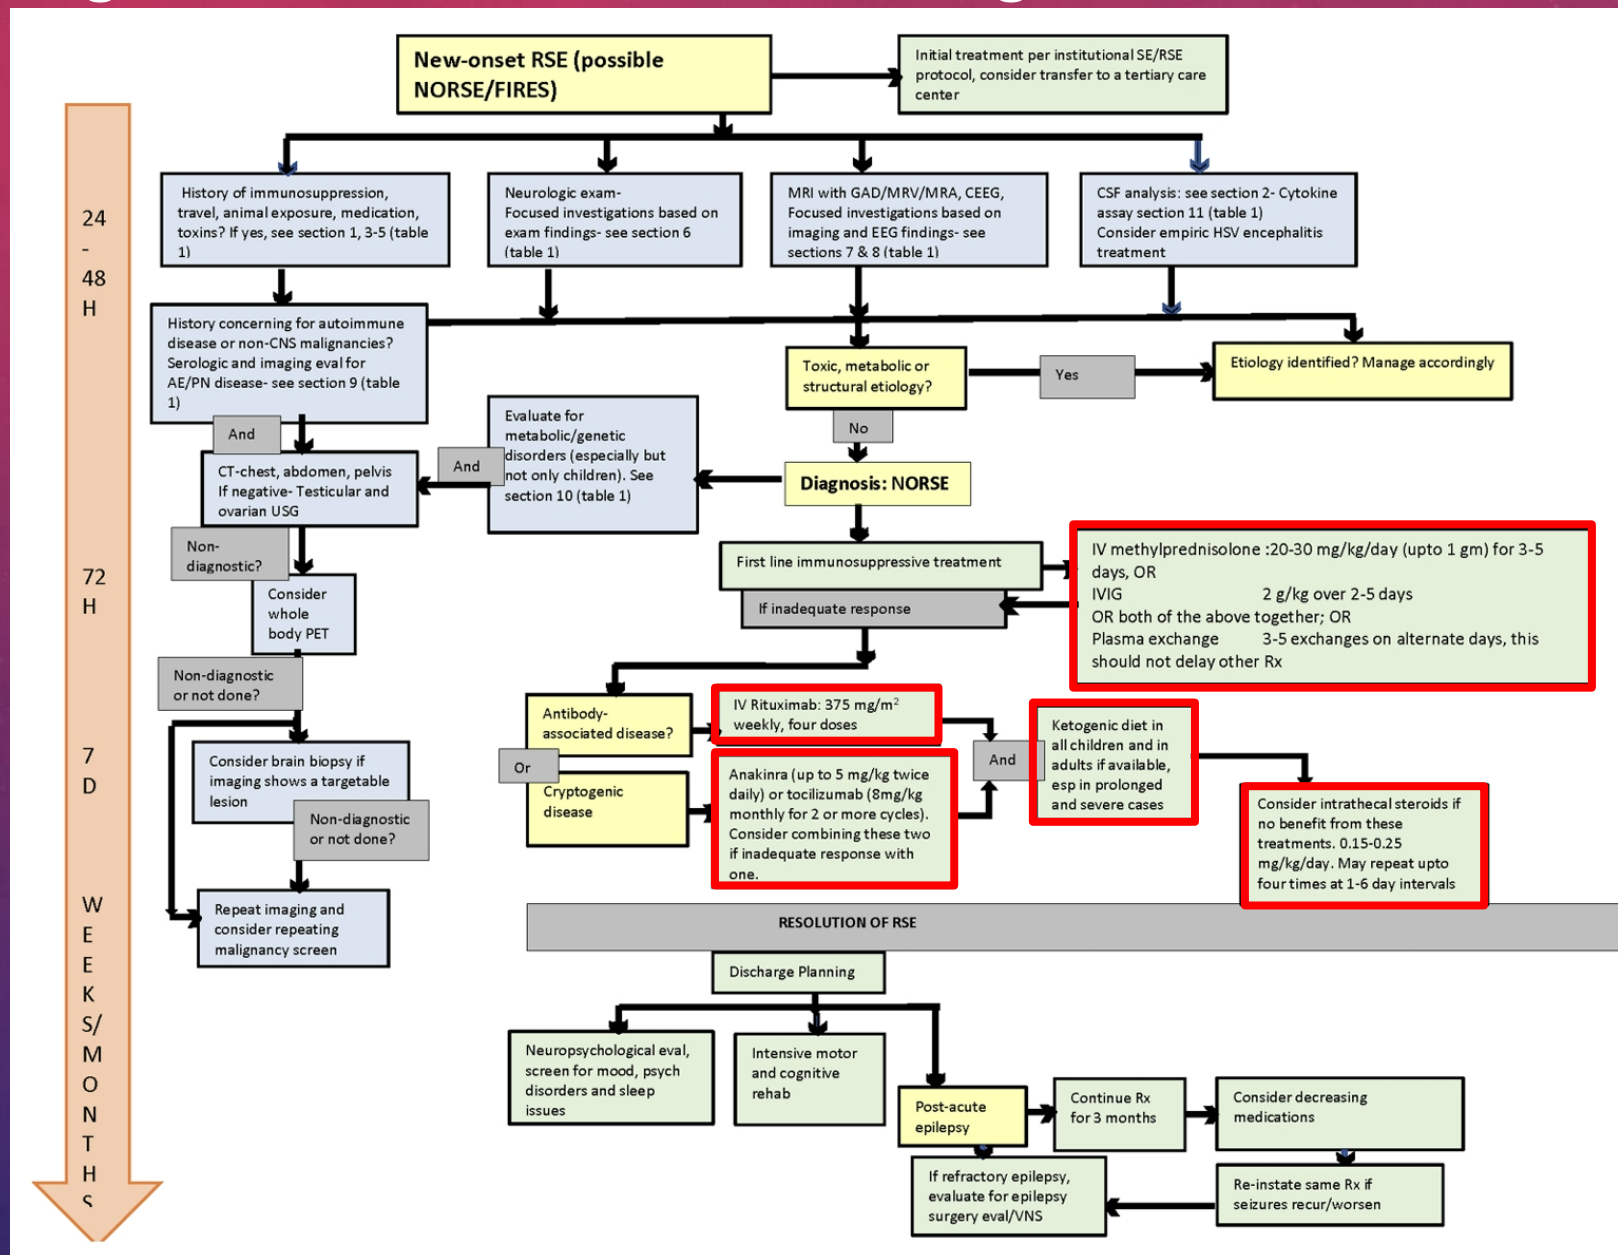

**Infection 10%**

**Inflammatory,  
autoimmune 40%**

**Genetic: rare** Mitochondrial,  
POLG1, SCN1A, PCDH19, CADASIL

Seizure 2019;68:72-8.

# Flow diagram for evaluation and management of NORSE/FIRES

# TREATMENT OF FIRES & NORSE

- Management of seizures in initial 24–48 h should be like any case of RSE
- First-line immunotherapy should begin within 72 h using steroids, IVIG, or plasmapheresis
- If no improvement, ketogenic diet and second-line immunotherapy should start within seven days
  - Rituximab if strong suggestion or proof of antibody-mediated disease
  - Anakinra or tocilizumab for cryptogenic cases
- Intensive motor and cognitive rehab are usually necessary
- Some may need continued immunologic treatments and epilepsy surgery evaluation

The background is a gradient from deep red at the top to dark blue at the bottom, speckled with white dots. On the left side, there are several concentric circles and a large circular scale with degree markings from 140 to 260. Some circles have arrows indicating a clockwise direction.

# **RASMUSSEN SYNDROME**

# RASMUSSEN SYNDROME

- Rare, severe chronic unilateral inflammation of cerebral cortex, drug-resistant epilepsy, and progressive neurological and cognitive deterioration
- Typical age of onset at 1–10 years (median 6 yrs)
- 10% adolescent and young adult
  - Clinical course in adolescent and adult usually slower and less severe final deficits

# RASMUSSEN SYNDROME: THREE STAGES

- **Initial prodromal phase (lasting months to years)**
  - Infrequent seizures and mild hemiparesis
- **Acute phase (lasting months to years)**
  - Increasingly frequent seizures, at times with EPC, progressive hemiparesis, hemianopia, cognitive, language deterioration
- **Chronic phase**
  - Permanent stable hemiparesis and other neurological disabilities, continued seizures (less frequent than in acute stage)

# Natural clinical course and expected effect of immunotherapy

# MRI: Progressive hemispheric atrophy

Atrophy of head of caudate +  
Subtle loss of volume of left insular region

‘FRONTO-INSULAR PREDILECTION’

Interval 8 years

Increased atrophy of left hemisphere

# EEG

- Unihemispheric slowing: first change
- Epileptiform discharges are present in affected hemisphere by 6 months
- Independent contralateral IED not present initially, seen increasingly after first few months, rising to 63- 94% by 4 to 5 years
- Unilateral seizure onset: Electro-clinical or NCS
  - EPC lack electrographic correlate in 43%

**A**

**B**

# RASMUSSEN' ENCEPHALITIS DIAGNOSTIC CRITERIA OF BIEN ET AL (2005), SUGGESTED REVISIONS

Step 1: Check fulfillment of clinical, EEG, and MRI criteria in Part A (all 3)	
Part A	
Clinical	Focal seizures and unilateral cortical deficits
EEG	<i>Markedly lateralized</i> slowing <b>and</b> unilateral seizure onset
MRI	<i>Markedly lateralized</i> focal cortical atrophy <b>and</b> at least one of the following: <ul style="list-style-type: none"> <li>• Gray or white matter T2/FLAIR hyperintensity</li> <li>• Ipsilateral caudate head atrophy <b>or</b> T2/FLAIR hyperintensity</li> </ul>
Step 2: If criteria from Part A not fulfilled, check criteria in Part B (2 of 3)	
Part B	
Clinical	EPC <b>or</b> progressive <sup>a</sup> unilateral cortical deficits
MRI	Progressive <sup>a</sup> <i>markedly lateralized</i> cortical atrophy
Histopathology	T-cell–dominated encephalitis with activated microglial cells (typically, but not necessarily, forming nodules) and reactive astrogliosis; numerous parenchymal macrophages, B-cells, or plasma cells or viral inclusion bodies exclude the diagnosis of RE

## CORE DIAGNOSTIC CRITERIA FOR RASMUSSEN SYNDROME

Seizure	Focal/hemispheric seizures often increase in frequency over weeks to months
EEG	Hemispheric slowing and epileptiform abnormality
Imaging	Progressive hemiatrophy (early insula and head of caudate atrophy)
Long-term outcome	Drug-resistant epilepsy Progressive neurological deficits
MRI is required for diagnosis Ictal EEG is not required for diagnosis	

# Treatment: Medical therapy → Hemispheric disconnection surgery or hemispherectomy (only cure for seizure)

French Epilepsy congress 2021  
Rev Neurol (Paris.)2022;178(7):675-691.

*In case of immunotherapies failure -> re-evaluate surgical possibility  
If surgery not considered -> change immunotherapy*

The background is a gradient from deep red at the top to dark blue at the bottom, speckled with white dots resembling stars. Overlaid on this are several faint, white circular and semi-circular lines, some with arrows indicating a clockwise direction. A large, semi-circular scale with numerical markings (40, 150, 160, 170, 180, 190, 210, 220, 230, 240, 250, 260) is visible on the left side, partially obscured by the text.

# **PROGRESSIVE MYOCLONIC EPILEPSY**

# PME: GROUP OF NEURODEGENERATIVE DISEASE

## DEBILITATING EVOLUTION, RESISTANCE TO TREATMENT, POOR PROGNOSIS

### Key features

- (1) Myoclonic seizure
- (2) Progressive motor and cognitive impairment
- (3) Sensory and cerebellar signs
- (4) Abnormal background slowing on EEG, generalized spike/polyspike
- (5) Prior normal development and cognition

# Photosensitivity is common feature

# Other features: ataxia, dysarthria, vision loss, hearing loss, neuropathy, myopathy

# May be family history, AR inheritance in most cases, but can be sporadic

# Usually childhood and adolescence onset

# Severity and prognosis depend upon etiology

Generalized PSW

PPR at low frequency photic stimulation 1-3 Hz

# PME (PROTOTYPES)

- Unverricht–Lundborg disease (ULD)
- Lafora disease
- Neuronal ceroid lipofuscinosis (NCL)
- Myoclonic epilepsy with ragged red fibers (MERRF)

# Key characteristic of etiologies of PME

PME type	Age at onset	Progression	Diagnosis
ULD	7–13 years	Slow cognitive and motor deterioration with stabilization in adulthood	Cystatin B ( <i>EMP1</i> ) expansion variations account for ~90% of cases worldwide
LD	6–19 years	Early rapid cognitive, vision, and motor deterioration; fatal approximately a decade after onset; <u>focal seizures with visual symptoms</u> are an early feature	Laforin ( <i>EMP2A</i> ) pathogenic gene variant in 70%, malin ( <i>EMP2B</i> ) pathogenic gene variant in 27%, no pathogenic variant found in 3%; Lafora bodies are seen in sweat duct cells or other tissues
CLN2	2–4 years	Initial speech delay and seizures, subsequently deterioration in cognition and motor skills, and then vision loss emerges at 4–6 years of age	<i>CLN2/TPP1</i> pathogenic gene variants; TPP1 enzyme activity is reduced; EEG can show a photoparoxysmal response at low (1–3 Hz) frequency; curvilinear bodies profile of lipofuscin accumulation in tissues (e.g., skin) or lymphocytes
CLN3	4–10 years	Rapidly progressing vision loss, with macular degeneration, optic atrophy ± retinitis pigmentosa; survival: late teens–30 years	<i>CLN3</i> pathogenic gene variants; fingerprint profile of lipofuscin accumulation in tissue (e.g., skin) or lymphocytes; lymphocytes are vacuolated
Adult onset NCL (type A)	11–50 years	Slow development of dementia and ataxia; visual impairment is not expected	<i>CLN6</i> pathogenic gene variants (pathogenic variants in <i>CTSD</i> , <i>PPT1</i> , <i>CLN3</i> , <i>CLN5</i> , <i>CTSF</i> , and <i>GRN</i> also reported); mixed type inclusions (fingerprint, curvilinear, rectilinear) in tissue (e.g., skin) or lymphocytes

Abbreviations: TPP1, tripeptidyl-peptidase 1; PME, progressive myoclonus epilepsies; MRI, magnetic resonance imaging; ULD, Unverricht–Lundborg disease; LD, Lafora disease; CLN, ceroid lipofuscinosis; NCL, neuronal ceroid lipofuscinosis; EEG, electroencephalogram.

# TREATMENT

- Pharmacotherapy: VPA, LEV, BZD, TPM, ZND, PER
- Dietary treatment; KD, modified atkins diet
- Neuromodulation: VNS, DBS, rTMS
- Immunomodulation
- Enzyme replacement therapy: cerliponase alpha (CLN2)
- Gene therapy
